# COMP9318: Data Warehousing and Data Mining

L6: Association Rule Mining

Problem definition and preliminaries

## What Is Association Mining?

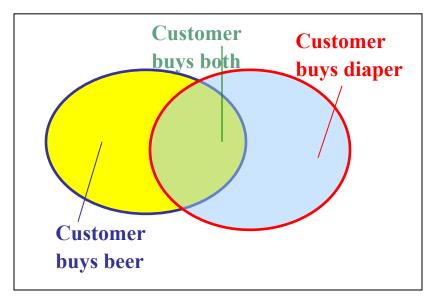

- Association rule mining:
  - Finding frequent patterns, associations, correlations, or causal structures among sets of items or objects in transaction databases, relational databases, and other information repositories.
  - Frequent pattern: pattern (set of items, sequence, etc.)
     that occurs frequently in a database [AIS93]
- Motivation: finding regularities in data
  - What products were often purchased together? Beer and diapers?!
  - What are the subsequent purchases after buying a PC?
  - What kinds of DNA are sensitive to this new drug?
  - Can we automatically classify web documents?

## Why Is Frequent Pattern or Assoiciation Mining an Essential Task in Data Mining?

- Foundation for many essential data mining tasks
  - Association, correlation, causality
  - Sequential patterns, temporal or cyclic association, partial periodicity, spatial and multimedia association
  - Associative classification, cluster analysis, iceberg cube, fascicles (semantic data compression)
- Broad applications
  - Basket data analysis, cross-marketing, catalog design, sale campaign analysis
  - Web log (click stream) analysis, DNA sequence analysis, etc.
     c.f., google's spelling suggestion

## Basic Concepts: Frequent Patterns and Association Rules

Transaction-id	Items bought
10	{ A, B, C }
20	{ A, C }
30	{ A, D }
40	{ B, E, F }

- Itemset X={x<sub>1</sub>, ..., x<sub>k</sub>}
  - **Shorthand**: x<sub>1</sub> x<sub>2</sub> ... x<sub>k</sub>
  - Find all the rules  $X \rightarrow Y$  with min confidence and support
    - support, *s*, probability that a transaction contains *X*∪ *Y*
    - confidence, c, conditional probability that a transaction having X also contains Y.

Let 
$$min\_support = 50\%$$
,

 $min\_conf = 70\%$ : frequent itemset

 $sup(AC) = 2$  association rule

 $A \Rightarrow C (50\%, 66.7\%)$ 
 $C \Rightarrow A (50\%, 100\%)$ 

## Mining Association Rules—an Example

Transaction-id	Items bought
10	A, B, C
20	A, C
30	A, D
40	B, E, F

Min. support 50%

Min. confidence 50%

Frequent pattern	Support
{A}	75%
{B}	50%
{C}	50%
{A, C}	50%

For rule  $A \rightarrow C$ :

support = support( $\{A\} \cup \{C\}$ ) = 50%

confidence = support( $\{A\} \cup \{C\}$ )/support( $\{A\}$ ) = 66.6%

major computation challenge: calculate the support of itemsets

← The *frequent itemset mining* problem

 Algorithms for scalable mining of (single-dimensional Boolean) association rules in transactional databases

## **Association Rule Mining Algorithms**

Candidate Generation & Verification

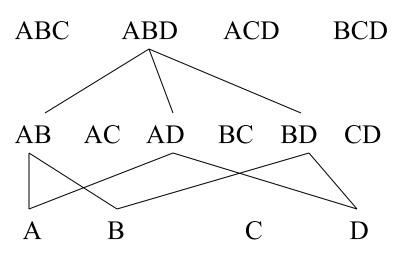

- Naïve algorithm
  - Enumerate all possible itemsets and check their support against min\_sup
  - Generate all association rules and check their confidence against min\_conf
- The Apriori property
  - Apriori Algorithm
  - FP-growth Algorithm

### All Candidate Itemsets for {A, B, C, D, E}

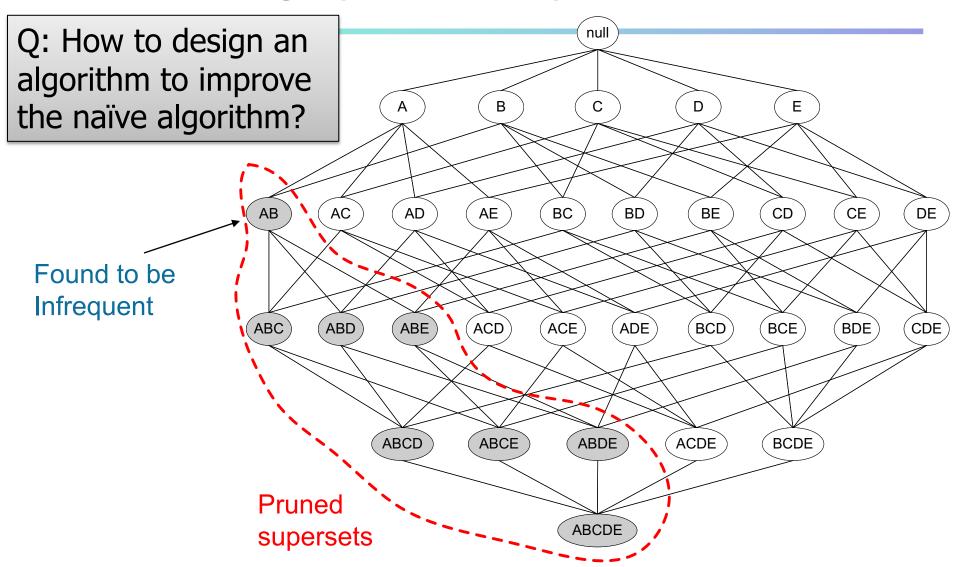

## **Apriori Property**

- A frequent (used to be called large) itemset is an itemset whose support is ≥ min\_sup.
- Apriori property (downward closure): any subsets of a frequent itemset are also frequent itemsets
- Aka the anti-monotone property of support

"any supersets of an infrequent itemset are also infrequent itemsets"

## Illustrating Apriori Principle

#### Apriori: A Candidate Generation-and-test Approach

- Apriori pruning principle: If there is any itemset which is infrequent, its superset should not be generated/tested!
- Algorithm [Agrawal & Srikant 1994]
  - C<sub>k</sub> ← Perform level-wise candidate generation (from singleton itemsets)
  - 2.  $L_k \leftarrow Verify C_k against L_k$
  - 3.  $C_{k+1} \leftarrow generated from L_k$
  - 4. Goto 2 if  $C_{k+1}$  is not empty

## The Apriori Algorithm

#### Pseudo-code:

```
C<sub>k</sub>: Candidate itemset of size k
L_k: frequent itemset of size k
L_1 = \{ frequent items \};
for (k = 1; L_k !=\emptyset; k++) do begin
     C_{k+1} = candidates generated from L_k;
     for each transaction t in database do begin
          increment the count of all candidates in C_{k+1}
          that are contained in t
    end
    L_{k+1} = candidates in C_{k+1} with min support
end
return U_k L_k;
```

## The Apriori Algorithm—An Example

minsup = 50%

#### Database TDB

Tid	Items
10	A, C, D
20	В, С, Е
30	A, B, C, E
40	B, E

 $C_I$ 1st scan

Itemset	sup
{A}	2
{B}	3
{C}	3
{D}	1
{E}	3

	Itemset	sup
$L_{I}$	{A}	2
	{B}	3
	{C}	3
	{E}	3

 C2
 Itemset
 sup

 {A, B}

 {A, C}
 2

 {A, E}
 1

 {B, C}
 2

 {B, E}
 3

 {C, E}
 2

 $2^{\text{nd}} \text{ scan}$ 

Itemset
{A, B}
{A, C}
{A, E}
{B, C}
{B, E}
{C, E}

 $C_3$  Itemset {B, C, E}

 $3^{\text{rd}}$  scan L

Itemset	sup
{B, C, E}	2

## Important Details of Apriori

- How to generate candidates?
  - Step 1: self-joining  $L_k$  (what's the join condition? why?)
  - Step 2: pruning
- 2. How to count supports of candidates?

#### **Example of Candidate-generation**

- *L*<sub>3</sub>={abc, abd, acd, ace, bcd}
- Self-joining:  $L_3*L_3$ 
  - abcd from abc and abd
  - acde from acd and ace
- Pruning:
  - *acde* is removed because *ade* is not in  $L_3$
- $C_4=\{abcd\}$

## Generating Candidates in SQL

- Suppose the items in  $L_{k-1}$  are listed in an order
- Step 1: self-joining  $L_{k-1}$

```
insert into C_k

select p.item_1, p.item_2, ..., p.item_{k-1}, q.item_{k-1}

from L_{k-1} p, L_{k-1} q

where p.item_1 = q.item_1, ..., p.item_{k-2} = q.item_{k-2}, p.item_{k-1} < q.item_{k-1}
```

Step 2: pruning

```
for all itemsets c in C_k do for all (k-1)-subsets s of c do if (s is not in L_{k-1}) then delete c from C_k
```

## Derive rules from frequent itemsets

- Frequent itemsets != association rules
- One more step is required to find association rules
- For each frequent itemset X,
   For each proper nonempty subset A of X,
  - Let B = X A
  - $\bullet$  A  $\rightarrow$  B is an association rule if
    - Confidence (A → B) ≥ min\_conf,
       where support (A → B) = support (AB), and
       confidence (A → B) = support (AB) / support (A)

## Example – deriving rules from frequent itemsets

- Suppose 234 is frequent, with supp=50%
  - Proper nonempty subsets: 23, 24, 34, 2, 3, 4, with supp=50%, 50%, 75%, 75%, 75%, 75% respectively
  - These generate these association rules:

```
23 => 4, confidence=100%
```

= (N\* 50%)/(N\*75%)

All rules have support = 50%

Q: is there any optimization (e.g., pruning) for this step?

## Deriving rules

- To recap, in order to obtain A → B, we need to have Support(AB) and Support(A)
- This step is not as time-consuming as frequent itemsets generation
  - Why?
- It's also easy to speedup using techniques such as parallel processing.
  - How?
- Do we really need candidate generation for deriving association rules?
  - Frequent-Pattern Growth (FP-Tree)

## Bottleneck of Frequent-pattern Mining

- Multiple database scans are costly
- Mining long patterns needs many passes of scanning and generates lots of candidates
  - To find frequent itemset  $i_1i_2...i_{100}$ 
    - # of scans: 100 • # of Candidates:  $\binom{100}{1} + \binom{100}{2} + \ldots + \binom{100}{100} = 2^{100} - 1$
- Bottleneck: candidate-generation-and-test

Can we avoid candidate generation altogether?

## FP-growth

	<u>J</u> ava	<u>L</u> isp	<u>S</u> cheme	<u>P</u> ython	<u>R</u> uby
Alice	X				X
Bob				X	X
Charlie	X			X	X
Dora		X	X		

minsup = 1

#### Apriori:

- $L_1 = \{J, L, S, P, R\}$
- $C_2$  = all the  $\binom{5}{2}$  combinations
  - Most of C<sub>2</sub> do not contribute to the result
  - There is no way to tell because

	<u>J</u> ava	<u>L</u> isp	<u>S</u> cheme	<u>P</u> ython	<u>R</u> uby
Alice	X				X
Bob				X	X
Charlie	X			X	X
Dora		Х	Х		

#### Ideas:

- Keep the support set for each frequent itemset
- DFS

J → ???

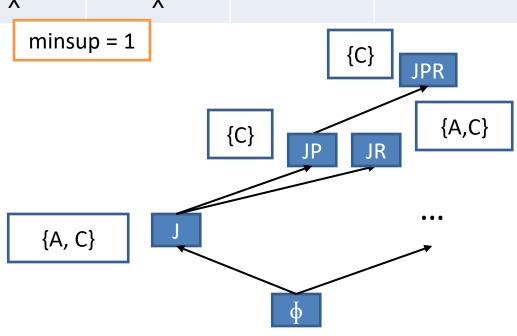

Only need to look at support set for J

Alice	X				X
Bob				X	X
Charlie	X			X	X
Dora		Х	X		

#### Ideas:

- Keep the support set for each frequent itemset
- DFS

#### **Notations and Invariants**

- CondiditionalDB:
  - $DB|p = \{t \in DB \mid t \text{ contains itemset } p\}$
  - DB = DB  $| \emptyset$  (i.e., conditioned on nothing)
  - Shorthand:  $DB|px = DB|(p \cup x)$
- SupportSet( $p \cup x$ , DB) = SupportSet(x, DB|p)
  - $\{x \mid x \mod 6 = 0 \land x \in [100]\} = \{x \mid x \mod 3 = 0 \land x \in even([100])\}$
- A FP-tree|p is equivalent to a DB|p
  - One can be converted to another
  - Next, we illustrate the alg using conditionalDB

## FP-tree Essential Idea /1

Recursive algorithm again!

Freq**Itemsets**(DB|p): / itemsets) are

easy task, as only items (not itemsets) are needed

all frequent itemsets in DB|p belong to one of the following categories:

X = FindFrequentItems(DB|p)

output  $\{(x p) \mid x \in X\}$ 

Foreach x in X

DB\*|px = GetConditionalDB+(DB\*|p, x)

patterns ~  $x_ip$ patterns ~  $\bigstar px_1$ patterns ~  $\bigstar px_2$ patterns ~  $\bigstar px_i$ patterns ~  $\bigstar px_i$ patterns ~  $\bigstar px_i$ 

FreqItemsets(DB\*|px)

DB|J

	<u>J</u> ava	<u>L</u> isp	<u>S</u> cheme	<u>P</u> ython	<u>R</u> uby
Alice	X				X
Charlie	X			X	X

minsup = 1

### FreqItemsets(DB|J):

- {P, R} ← FindFrequentItems(DB|J)
- Output {JP, JR}
- Get DB\*|JP; FreqItemsets(DB\*|JP)
- Get DB\*|JR; FreqItemsets(DB\*|JR)
- // Guaranteed no other frequent itemset in DB|J

## FP-tree Essential Idea /2

- FreqItemsets(DB|p):
  - If boundary condition, then ...
  - X = FindFrequentItems(DB|p)
  - [optional] DB\*|p = PruneDB(DB|p, X) output { (x p) | x ∈ X }
  - Foreach x in X
    - DB\*|px = GetConditionalDB+(DB\*|p, x)
    - [optional] if DB\*|px is degenerated, then powerset(DB\*|px)
    - FreqItemsets(DB\*|px)

Also output each item in X (appended with the conditional pattern)

Remove items not in X; potentially reduce # of transactions (Ø or dup). Improves the efficiency.

Also gets rid of items already processed before x → avoid duplicates

#### Lv 1 Recursion

F

## I will give you back the FP-tree

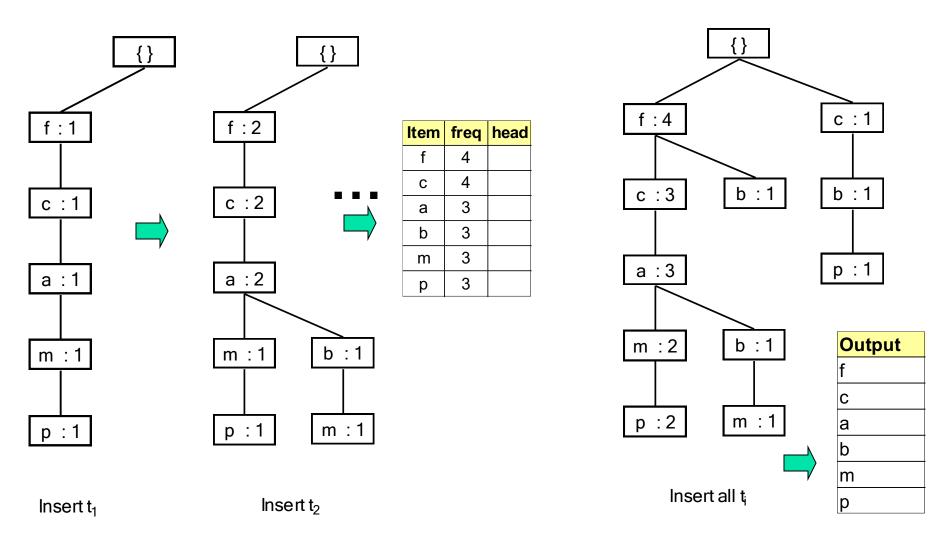

- An FP-tree tree of DB consists of:
  - A fixed order among items in DB
  - A prefix, threaded tree of sorted transactions in DB
  - Header table: (item, freq, ptr)
- When used in the algorithm, the input DB is always pruned (c.f., PruneDB())
  - Remove infequent items
  - Remove infrequent items in every transaction

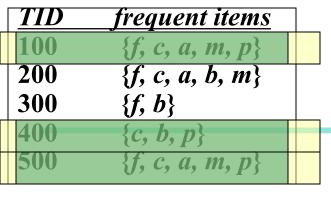

## FP-tree Example

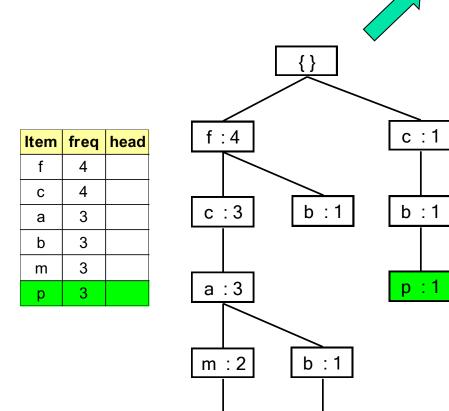

minsup = 3

<u>TID</u>	Items bought (ord	ered) frequent items
100	$\{f, a, c, d, g, i, m, p\}$	$\{f, c, a, m, p\}$
200	$\{a, b, c, f, l, m, o\}$	$\{f, c, a, b, m\}$
300	$\{b, f, h, j, o, w\}$	$\{f, b\}$
400	$\{b, c, k, s, p\}$	$\{c, b, p\}$
500	$\{a, f, c, e, l, p, m, n\}$	$\{f, c, a, m, p\}$

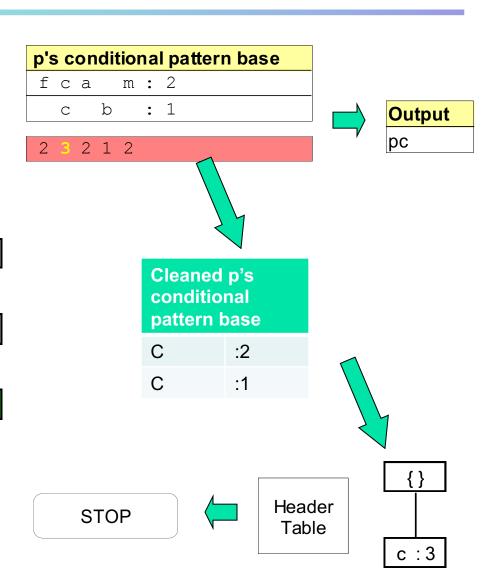

<b>TID</b>	Items bought (or	rdered) frequent items

b	3	

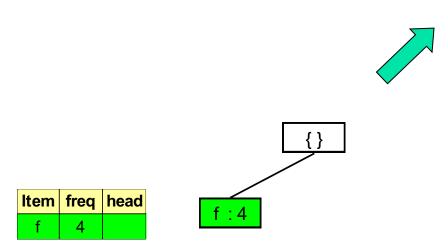

STOP

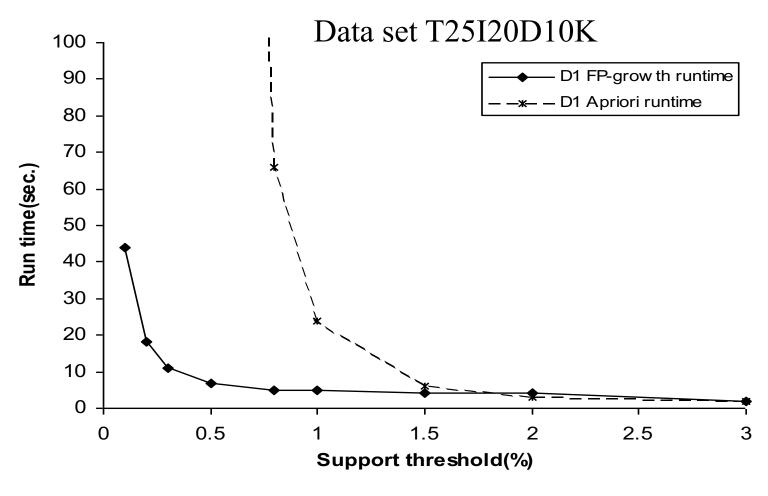

STOP

## FP-Growth vs. Apriori: Scalability With the Support Threshold

### Why Is FP-Growth the Winner?

- Divide-and-conquer:
  - decompose both the mining task and DB according to the frequent patterns obtained so far
  - leads to focused search of smaller databases
- Other factors
  - no candidate generation, no candidate test
  - compressed database: FP-tree structure
  - no repeated scan of entire database
  - basic ops—counting local freq items and building sub
     FP-tree, no pattern search and matching
